

### Landscaping Works Status in Condado de Alhama

We are pleased to inform you about the current state of the landscaping works, as well as the development of the next phase that will be carried out.

As you can see in the pictures shown below, the central median of the road is already finished in the section between the first and the second roundabouts. You can distinguish areas of yellow gravel, where a line of oleander (*Nerium oleander 'Nana'*) has been planted, and areas covered by pine bark alternated by curved shapes, where we also find pink gaura (*Gaura lindheimeri*), rosemary creeping (*Rosmarinus officinalis 'Prostratus'*) and creeping myoporium (*Myoporum parvifolium*). With these plant species we want to test with different colors and textures that provide added aesthetic and landscape value, as well as improving water efficiency, since these are species require low water consumption.

We have also finished the second roundabout from the main access, which is located after the first section of the central median of the road that has already been completed and which we mentioned in the previous paragraph. In it the three olive trees have been maintained and a yellow gravel base divided by two stone walls of curved shapes has been installed. In the interior surface formed between them a pine bark base has been integrated on which needle grass (*Nasella tenuissima*) has been planted, another plant species with low hydric requirements and adapted to our environment. This set of elements provides a more pleasing image and the roundabout acquires an added landscape and aesthetic value.

We are currently working on the transformation of the central median of the road that is between the second and third roundabout, as well as in the third roundabout. In this way we want to connect all the main access to the entrance of the Resort. Likewise, we will continue with the lateral landscaping that borders the wall next to the complex.
